01 Summary

The April 25 sprint focused on a complete visual redesign of the AMS (Attendance Management System) frontend, replacing the existing light-blue theme with a dark navy, hot-pink, and teal design system derived from the approved wireframe. CSS files for all major views were rewritten as drop-in replacements, the login page was restructured as a split-panel layout, and a new favicon was generated. No backend or Razor logic was modified — the sprint was purely cosmetic, delivering a production-ready reskin that matches the wireframe's visual language.

02 Tasks Completed

Analysed wireframe (AMS_Wireframe_v9_redesigned.html) — extracted design tokens: navy backgrounds (#0b1320, #0d1a2a), hot-pink accent (#d81b60), teal highlights (#38bdf8), Outfit + Plus Jakarta Sans typography, zero border-radius, clip-path buttons	DONE
Rewrote site.css — global CSS variables, font imports, sidebar active-state pink left-border, dark nav background, scrollbar theming	DONE
Rewrote login.css — split-panel layout (form left / background image right), clip-path polygon submit button, pink glow on logo, scanline overlay effect	DONE
Rewrote dashboard.css — dark stat cards with pink top border, teal icon accents, dark table with pink row-hover	DONE
Rewrote students.css — dark card container, teal ID badges, pink action buttons, modal dark styling with pink header	DONE
Rewrote teachers.css — consistent dark card, teal subject badges, pink pagination active state, modal matching student design	DONE
Rewrote courses.css — dark course cards with teal outline on hover, pink enroll button, status badges	DONE
Rewrote attendance.css — dark attendance table, pink present/status indicators, teal filter chip styling	DONE
Rewrote toast.css — dark toast container, pink success/error accent bars, slide-in animation preserved	DONE

Updated _Layout.cshtml — replaced text logo with an img tag pointing to logo.png, retaining pink glow CSS class

DONE

Restructured Login.cshtml — new two-column split-panel HTML, background.png rendered on right panel, existing Razor form bindings untouched

DONE

Generated new favicon.ico — dark navy background with pink 'A' monogram, delivered as downloadable ICO file

DONE

03 Challenges Encountered

Matching wireframe clip-path geometry

The wireframe used `polygon()` clip-path on the login button and sidebar active indicator. Replicating the exact skew angle required trial-and-error with the polygon coordinates to match the source design precisely.

Font availability in browser vs. design

Outfit and Plus Jakarta Sans required Google Fonts CDN imports in the layout. Care was taken to ensure the `@import` was placed before any existing font rules so the new typefaces are not overridden.

Split-panel login without breaking model binding

Restructuring Login.cshtml into a two-column layout risked disrupting the existing asp-for bindings and validation tag helpers. The form was wrapped inside the new left-panel div without altering any Razor attributes.

Image paths for logo and background

The CSS references `wwwroot/images/logo.png` and `background.png`. Because the redesign was delivered as file replacements rather than a live environment, the correct physical files must be placed in `wwwroot/images/` by the developer for the paths to resolve correctly.

04 Plans for Next Session

- Install and configure PostgreSQL locally — set up the database, run migrations using `dotnet ef database update`, and verify the backend starts successfully.
- Run both frontend and backend simultaneously — confirm API calls from the MVC frontend reach the local backend and return valid responses.
- Test the login flow end-to-end — verify JWT token is received, stored in session, and attached to subsequent API requests correctly.
- Begin testing remaining API endpoints — Students, Teachers, Courses, and Attendance pages to confirm data loads and displays as expected.
- Cross-browser check — verify the redesigned CSS renders consistently in Chrome, Edge, and Firefox before the next team review.
